

The popper spacers are to help keep the full tray and guide tray from nesting tightly. If the spacers are a tight fit or are glued in place they will keep the guide tray from pulling up when you lift off the full tray.

How to use Popper spacers:

1. Pull spacers off of pins remembering which pins the spacers are on.  
Note: The 6 spacers usually go near the 4 corners, and 2 in the middle, approximately evenly spaced.
2. Put an empty, new or good condition, tray on the pins
3. Put the spacers back on the pins they came off of.  
Note: Some may be difficult to push on. You will have to use a tool to push them all the way down.  
Note 2: You may eventually want to glue the spacers in place to keep the guide tray from pulling up when you pull the full tray off.
4. You should be ready to pop a full tray now using the empty tray with spacers as a guide.

Thank you for your purchase!

These photos show the approximate location of where the spacers should go.
